SPRING SEASON TERMS ON US!

LET OUR TEAM HELP YOU START THE YEAR ON THE RIGHT FOOT.

Our Tessman Greenhouse Sales Team boast over 50 years of greenhouse production experience.

Enjoy Industry Leading Spring Season Terms on Us!

All orders placed out of the warehouse will receive automatic **June 7th, 2022** dating.

**Some exclusions may apply, not valid on clearance items.*

**Account must be in good standing.*

We're here
to help
you!

Terms and Conditions:

Extended Season Terms for 2022: Fill-In orders for seasonal products ordered out of the warehouse have been extended to June 7, 2022.

Modine Heater Sale: Terms Extended to June 9, 2022 or Receive a 5% Product Discount - Net 30 (Dropship Orders Only)

All Invoiced Orders with Extended or Product Discounted Terms must be paid by Check, Cash or Money Order. Credit Card payments will not be accepted.

PUT AWAY YOUR SCISSORS!

Over the past 2 years, no matter where you look, everyone is hiring. The greenhouse industry has not been immune to this and over and over as I visit greenhouses, I hear about how hard it is to find employees. As we head into the 2022 season that doesn't seem to be changing so maybe we need to look at ways that we can be more efficient.

One step toward efficiency (and producing a high-quality crop) is using PGR's-Plant Growth Regulators. We've all heard the horror stories about plugs that didn't grow or plants that didn't flower. Don't let this deter you from using PGR's. Typically, it isn't the fault of the PGR but rather a mistake by the applicator. A common misconception is that PGR's stunt growth, but in reality, they shorten internodes and thicken stems (creating a shorter, stockier plant) and create a plant that is darker green and more drought tolerant. When used in conjunction with good crop scheduling, PGR's can be a huge labor saver.

So, if PGRs are new to you, start small and start with PGR's that are forgiving. I would recommend starting with a combination of B-nine (2500ppm or 2 scoops per gallon) and Cycocel (1000ppm or 1.08 fl oz. per gallon) and try it on your petunias. A surfactant such as Capsil (1/2 tsp. per gallon) can also be added. On Petunias, the first application is around 2-3 weeks from transplant or when the roots have reached the bottom of the pot and the leaves are nearly to the edge of the container. Apply late in the day or first thing in the morning when the light intensity is low to non-wilted plants. Spray just until leaves glisten, not to run-off.

When using PGRs for the first time or trying it on a variety or series that is new to you, it is a good idea to do a trial on part of a crop to see how the plants react. Once you get some practice, you can produce your

best petunia crop ever with no pinching or cutting back whatsoever.

The photo below is an example of a customer using B-nine/Cycocel for the first time on their petunias last year. These plants were never pinched!

Petunias on the left treated with one application of B-nine (2500ppm) and Cycocel (1000ppm)

Now that you are ready give PGR's a try, just a bit of information about an upcoming label change. Sometime in the near future, Cycocel is getting a new name. It will soon be called Altercel. Nothing else will change, just a new name.

Don't let PGR's scare you. If you think that you would like to give them a try, we would be happy to help you get started. And remember, start small until you get comfortable using them.

WHAT'S BUGGING STEVE?

I know. I know. Depending on the day this could be almost anything. But today it's Western Flower Thrips (WFT)! These guys can be difficult to get under control once a population has been allowed to grow unchecked. Let's have a look at WFT and what can be done to keep it under control.

LIFE CYCLE

Typical life cycle for thrips is 21 days. They have an egg, 2 larval, 2 pupal and an adult stage. The larval stage is when most plant damage is done. The pupal stage is in the soil or leaf litter. Control of this stage is difficult. The adults are capable of transporting viruses from plant to plant.

DAMAGE

WFT cause stippling, scarring, and silvering of leaf surfaces. They cause damage by piercing a leaf or flower bud with one mouth part and sucking out the plant fluids with a stylet.

SCOUTING

Scouting for WFT doesn't have to be difficult and it is extremely important. Knowing the usual suspects will make finding WFT easy. They love dahlias and gerbera daisy. Snip off a flower and simply tap it out on your palm or a piece of white paper. If thrips are present, they will be seen scurrying on you or the paper. Sometimes even blowing on a bloom will cause WFT to move about and be visible.

Yellow (or blue) sticky cards are also a great way to scout for WFT. There should be a card out for every 1,000 square feet of greenhouse. They must be checked and recorded regularly. This will tell if you have a WFT population and if your control efforts are working. To evaluate your treatment program, you have to know if the population is increasing at an increasing rate, increasing at a decreasing rate or just plain old decreasing. If your population is increasing at an increasing rate, your control is not working at all. If you are increasing at a decreasing rate, control is working but only marginally. Your population is still growing, just not as fast as before treatment started. Plain old decreasing is the goal. You want your population to be getting smaller.

CONTROL

The first line of defense when controlling thrips is a clean greenhouse. Keep weeds to a minimum and clean up any debris like spilled soil or piles of dead leaves.

There are many chemicals labeled for the control of WFT. Growers have had success with Overture, Pylon, Mainspring, Pedestal, Pradia and Conserve to name a few. I won't bore you with MOAs, REIs or RNA synthesis interruption. Just remember to rotate between chemical classes, use the proper volume for the area you are treating (1 gallon per 200 square feet) and to stay on top of it. To get control of a thrips population may require you to spray every 5 to 7 days for a month or more.

Good luck and let us know if you have any questions.

THE BENEFITS OF BUGS

Controlling Western Flower Thrips (WFT) in the greenhouse is all about early suppression and diligence. The use of beneficial predatory mites and insects from plug to market helps produce the highest quality product for your customers while reducing chemical use and preventing plant damage all season long. You also can apply beneficials without having to worry about MOAs, REIs or rotating products to prevent resistance. Below are the main predators that will target Western Flower Thrips, breaking their life cycle and suppressing populations.

STRATIOforce

Stratiolaelaps scimitus is a predatory mite that lives in the top half inch of soil. They are mainly used for the prevention, control, and management of fungus gnats and certain thrips species that pupate in the soil/on the ground. This affinity for eating thrips pupae is an underrated benefit of using these mites. Western flower thrips,

for example, spend a third of their lives in the soil. This has a substantial impact on the overall population. Using only *S. scimitus* can reduce western flower thrips population by 43%.

AMBLYforce C

Amblyseius cucumeris, the thrips predatory mite, are useful for the prevention, control, and management of various thrips species.

A. cucumeris are tough flexible predators that happen to prefer thrips, mostly the immature thrips stages. These predators are supplied two different ways: a bulk product in vermiculite for fast distribution and consumption; and a sachet product for slow preventive releases over an 5-7 week period. And, as an *Amblyseius* spp., these predators may eat other pests as well. AMBLYforce™ C is very cost-effective. These predators enjoy snacking on available pollen. This helps them be an efficient long-term preventive agent as well as a curative one. And, when supplied in slow-release packets, they are even

more outstanding. These mites are very, very economical. This is the only commercially produced *A. cucumeris* in the US. Any other *A. cucumeris* product will have spent days traveling from Canada or Europe.

ORIUStorce

Orius insidiosus is an aggressive thrips predator – possibly the most effective. It attacks and kills all mobile stages of thrips, including adult thrips. A ‘generalist’ predator, Orius feeds on many pest species, such as mites, aphids and moth eggs for food. Adults live approximately three to four weeks. Orius is aggressive – it consumes 12 thrips per day

but kills many more (45) than it eats. In addition to its predatory nature, Orius can feed on pollen if prey is scarce.

Our partners at Beneficial Insectary have a wide range of predatory mites and insects for the control of all common greenhouse pests. Ask your sales representative for more information on beneficials available, application rates, and scheduling.

START YOUR SEASON *Clean!*

Start your season clean by dipping or drenching your plants with this fungicide / insecticide mixture!

3336 F (disease control)

Drip (2 oz/10 gal)
Drench (8-16 oz/gal concentrate)

- Botrytis, Fusarium, Rhizoctonia, Sclerotinia, Thielaviopsis

Minx II or Abamectin 0.15 EC (insect control)

Drip (1 oz/10 gal)
Drench (8oz/gal concentrate)

- Mites, Aphids (suppression), Thrips (suppression), Whiteflies (suppression)

Usage Rates are the same wither mixing Minx 2 or Abamectin 0.15 EC

Mefenoxam (disease control)

Drip (0.1 oz/10 gal)
Drench (0.5-1 oz/gal concentrate)

- Pythium, Phytophthora, Downy Mildew

Safari (insect control)

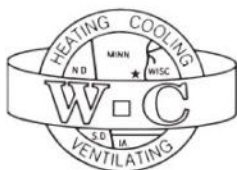

Drip (1.2-2.4 oz (dry weight)/10 gal)
Drench (12-24 oz (dry weight)/gal concentrate)

- Aphids, Fungus Gnats (larvae), Leafminers, Scales, Thrips (suppression), Whiteflies
